

Netcat shell with password protection

Author : Vittorio Milazzo
Date : 17/07/2013

This is simple example, that show how to ask a password before to give a shell with netcat. In this case netcat will start in persistent listener mode (through while loop).

```
#!/bin/bash
#
ncpassword () {

NC="/bin/netcat"
PORT="999"
PASSWORD="123456"
SHELL="/bin/bash"

echo -n "Enter password: "

stty -echo
read mypass
stty echo

if [ ${mypass} = $PASSWORD ]
    then
        echo "Access granted...start netcat shell on port $PORT"
        while true; do $NC -l -p $PORT -e $SHELL; done
    else
        echo "Incorrect Password"
fi
}

ncpassword
sh $0
```
